Import from URL

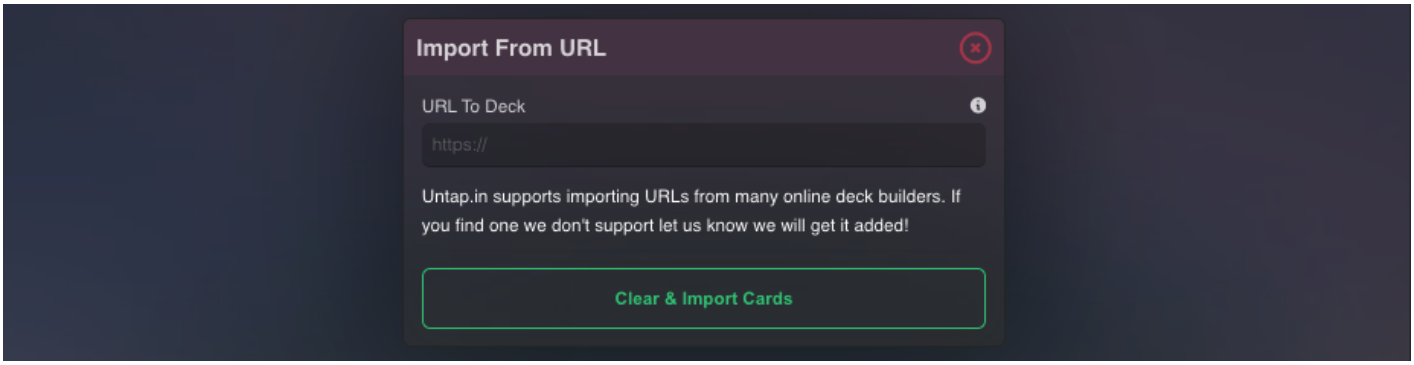

You can import deck from your favorite Deckbuilders Services!

If you're an active TCG player you are probably using a deckbuilder to keep your decklists on hand. You can usually share the url to your friends for them to check it out, and so can Untap.

Opening **newly created deck** will display the 2 buttons you see above.
Click the **"Import from URL"** button.

On an older deck, without a previously set import URL.
You will find the option in the deck menu at the top right.

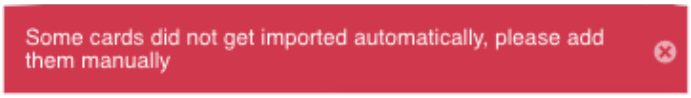

> Once a URL has been set to a deck you cannot change it.
> You can, however duplicate the deck, the copy can be edited

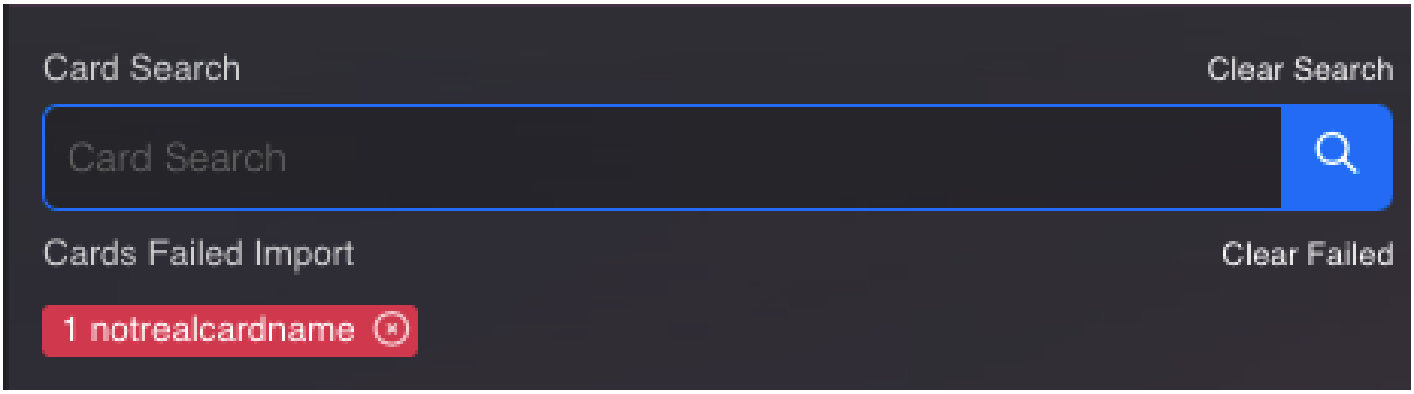

You can now **paste the link** to your deck and import the cards

Congrats your deck is now synced!
Edits you make to it on the platform can be synced thanks to a button.

Some of the cards may not be found for multiple reasons.
You will see a notification appear letting you know.

If this happen you will need to **look for and find** the missing cards to add them to your deck.

If the service you're using has cards with a different name templating than the cards we have in our database the sync will break everytime you sync it.

Make sure your deck is publicly accessible.
To verify try to open the link in an incognito tab, if the page and the deck shows up you're good to go.

We support deck imports from the following websites:
